

Phase3:

Assisted practice project:

Microservices Communication in Spring Boot

```
package com.example.test;

import org.springframework.boot.SpringApplication;
import org.springframework.boot.autoconfigure.SpringBootApplication;

@SpringBootApplication
public class RestApiOneApplication {

    public static void main(String[] args) {
        SpringApplication.run(RestApiOneApplication.class, args);
    }

}
```

Creating an entity class:

```
package com.example.test;

import javax.persistence.Column;
import javax.persistence.Entity;
import javax.persistence.GeneratedValue;
import javax.persistence.GenerationType;
import javax.persistence.Id;

@Entity
public class PersonEntity {

    @Id
    @GeneratedValue(strategy = GenerationType.AUTO)
    @Column(name = "id", updatable = false, nullable = false)
    private Integer personId;
    @Column
    private String name;
    @Column
    private Integer age;

    public PersonEntity() {
        super();
    }

    public PersonEntity(Integer personId, String name, Integer age) {
        super();
        this.personId = personId;
        this.name = name;
        this.age = age;
    }

}
```

```

    }
    public Integer getPersonId() {
        return personId;
    }
    public void setPersonId(Integer personId) {
        this.personId = personId;
    }
    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }
    public Integer getAge() {
        return age;
    }
    public void setAge(Integer age) {
        this.age = age;
    }
}

```

Creating a Repository class:

```

package com.example.test;

import org.springframework.data.jpa.repository.JpaRepository;
import org.springframework.stereotype.Repository;

@Repository
public interface PersonRepository extends JpaRepository<PersonEntity, Integer> {

}

```

Creating a service class:

```

package com.example.test;

import java.util.HashMap;
import java.util.Map;

import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.stereotype.Service;
import org.springframework.web.client.RestTemplate;

@Service
public class PersonService {

    @Autowired
    PersonRepository personRepository;

    RestTemplate restTemplate = new RestTemplate();
}

```

```

public PersonResonse getPerson(int personId){
    final String uri = "http://localhost:8082/webapitwo/hobby/{personId}";

    Map<String, Integer> params = new HashMap<String, Integer>();
    params.put("personId", personId);

    String result = restTemplate.getForObject(uri, String.class, params);
    PersonEntity pe=personRepository.findById(personId).get();
    PersonResonse pr=new PersonResonse();
    pr.setPersonId(pe.getPersonId());
    pr.setName(pe.getName());
    pr.setAge(pe.getAge());
    pr.setHobby(result);

    return pr;
}
public void addPerson(PersonEntity pe){
    personRepository.save(pe);
}
}

```

Creating a controller class:

```

package com.example.test;

import org.springframework.beans.factory.annotation.Autowired;
import org.springframework.web.bind.annotation.PathVariable;
import org.springframework.web.bind.annotation.RequestBody;
import org.springframework.web.bind.annotation.RequestMapping;
import org.springframework.web.bind.annotation.RequestMethod;
import org.springframework.web.bind.annotation.RestController;

@RestController
@RequestMapping(path = "/webapione")
public class PersonControlller {

    @Autowired
    PersonService personService;

    @RequestMapping("/person/{personId}")
    public PersonResonse getPerson(@PathVariable int personId){
        return personService.getPerson(personId);
    }

    @RequestMapping(method=RequestMethod.POST, value="/person")
    public void addPerson(@RequestBody PersonEntity pe ) {
        personService.addPerson(pe);
    }
}

```

Creating a Response class:

```
package com.example.test;

public class PersonResonse {

    private Integer personId;
    private String name;
    private Integer age;
    private String hobby;
    public Integer getPersonId() {
        return personId;
    }
    public void setPersonId(Integer personId) {
        this.personId = personId;
    }
    public String getName() {
        return name;
    }
    public void setName(String name) {
        this.name = name;
    }
    public Integer getAge() {
        return age;
    }
    public void setAge(Integer age) {
        this.age = age;
    }
    public String getHobby() {
        return hobby;
    }
    public void setHobby(String result) {
        this.hobby = result;
    }
}
```

Setting the port number:

```
server.port=8081
spring.application.name=RestApiOne
```
